PRESENT DAY CLASSIFICATION OF BRYOPHYTES

Bryophyte

Hepaticopsida

130 genera, 1800 species

Order: *Ceratophyllales* (Moss like)
Jungermanniales (Scale moss)
Marchantiales (Marchantia)
Metzgeriales (Metzgeria)
Plagiochamales (Plagiochama)
Leptocarpales (Leptocarpus)
Monocleles (Monocleles)
Macrorhizales (Macrorhiza)

Based on the structure of gametophyte

Anthocerotopsida

7 genera and a single order

Order: *Anthocerotales*

Bryopsida

200 genera, 10000 species

Order: *Sphagnales*
Andreales
Toropterales
Andropogonales
Bryales
Funariales
Leskeales

Based on the structure of gametophyte and sporophyte, especially peristome

- Moss plant Funaria grows in dense patches or cushions in moist shady and cool places during the rainy seasons.
- It has a height of 3–5 cm, a radial symmetry with a differentiation of an axis or stem, leaves or phylloids and multicellular colorless branched rhizoids
- These are primitive multicellular, autotrophic, shade loving, amphibious plants.
- They reproduce by spore formation.
- They have no vascular system.
- Root like structures called rhizoids are present.
- They show alternation of generation i.e. the gametophytic stage alternates with the sporophytic stage
